Contribution Journal

Brian:

I helped with the coding part of the regression and classification lab, including writing code for the assigned sections and adding comments to explain the main steps. I also worked on the parts involving the creation, training, and testing of the models using the Titanic dataset. While completing these tasks, I checked the code and its outputs to make sure the sections were working properly.

Before finishing the lab, I helped review the notebook and check that the required code was included. I also participated in running the code and checking the results. My contribution focused on completing the coding tasks, explaining important parts with comments, and making sure the notebook was organized for submission.

Toan:

For the assigned sections, I worked on writing and organizing the Python code for the regression and classification tasks. I added comments to explain important lines and helped run the models with the Titanic dataset. I also checked the outputs from the code and reviewed the functions used in the notebook.

The lab required more than just writing the code. I helped check that each required section was included and that the notebook could run through the different steps. I also took part in reviewing the completed work before submission. These tasks were my main contributions to finishing the lab.

Montserrat:

My contribution included completing parts of the notebook, writing code for the assigned tasks, and adding comments to make the code easier to follow. I worked on the regression and classification sections and helped check the results after running the models on the Titanic dataset.

I also helped review the notebook to make sure the code sections and comments were in place. During the final check, I participated in running the code and reviewing the outputs to see if the required tasks had been completed. I contributed to preparing the notebook by checking the work and making sure the required sections were ready for submission.
